I have most of my website completed and I have synced it to github in addition to the basic tasks. Zip is too big that I cannot upload.

About the project I didn't keep the original replacement menu, but replaced it with a selection menu on the right side, and also used javascript with the menu to hide the elements.

I think the big challenge is that the typography of each project has forced me to create separate html structures, and I haven't learned to sort them out very well.

It is currently at 90% progress and I will further optimise it and release it as a private website.

I learned a lot in this class, but there are also a lot of points I need to learn independently, and completing this site has helped me understand more about front-end design, thanks!
